A city that makes movement legible

Transportation 2100 imagines a future city where air transit, smart roads, autonomous buses, and underground rail work as one readable mobility network. The experience uses a living 3D city as the visual context, then layers a calm journey-planning interface over it.

The design reasoning is human-first: the spectacle establishes place, but the interface prioritizes the next decision. Users first choose a transport layer, then choose a destination, review a route, and finally follow the vehicle live.

Core idea: make futuristic infrastructure feel as understandable as checking a familiar trip on a phone.

Design principles

- **Progressive disclosure:** transport choices appear before selection and clear away after a mode is chosen.
- **Scannability:** route time, transfer, safety, status, and destination are grouped into compact panels.
- **Feedback:** camera transitions, Framer Motion reveals, selected states, live labels, and route metrics explain system status.
- **Mobile reach:** controls use large touch targets, bottom navigation, and a responsive destination drawer.

Implemented system

React 18 + TypeScript

Component-driven application state and typed transit modes.

Vite 5

Fast development server and production bundling.

Three.js / React Three Fiber

Procedural anti-gravity city, stars, transport corridors, and camera states.

Framer Motion

Screen transitions, staggered route content, and interaction feedback.

Tailwind CSS + CSS

Responsive layout, glass panels, accessible focus states, and mobile breakpoints.

Lucide icons + Web Audio API

Consistent transport language and lightweight procedural sounds.

Home / Search

Choose a mode and destination

The opening screen presents the anti-gravity city and four transport choices: Air transport, Autonomous train, Autonomous bus, and Smart roads. Selecting a mode reveals the destination drawer with search, voice search, and quick destinations.

Route Details

Review the journey before departure

The route view turns a destination choice into an actionable plan: arrival time, total duration, transfer information, safety state, smart rebooking, a three-step timeline, and a clear Follow this journey action.

Live Tracking

Monitor the active journey

Live Tracking shows Rail 08 moving between Central Exchange and KDU Campus. A visual route map is paired with a simple status sheet for speed, current node, and safe travel conditions.

From city view to live journey

1

Explore.

Start in the 3D city overview and choose a transport layer.

2

Plan.

Select a quick destination such as Home Node, KDU Campus, or Central Sky Hub.

3

Review.

Check duration, transfer, safety, and the three-step route timeline.

4

Track.

Follow the journey and switch between map and linear progress views.

Interaction and accessibility

- Touch-friendly mobile controls and bottom navigation.
- High-contrast / large-text access mode.
- Visible selected, active, live, done, now, and next states.
- ARIA labels for transport, navigation, audio, route, and status controls.
- Audio can be muted with the persistent sound control.
- Keyboard shortcuts: 1 Air, 2 Smart Roads, 3 Sub-Rail, Esc/0 reset.
